Population, Health, and Human Well-Being—Sources and Definitions

Demographic and Health Indicators

Total Population refers to the de facto midyear population of a country. The U.N. Population Division compiles and evaluates census and survey results from all countries, adjusting data for the miscalculation of certain age and sex groups, misreporting of age and sex distributions, and changes in definitions, when necessary. These adjustments incorporate data from civil registrations, population surveys, earlier censuses, and population models based on information from socioeconomically similar countries. All projections assume medium levels of fertility.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=363&themeid=4

Population Density is calculated by WRI as the number of persons per square kilometer of land area. Population data are from the United Nations Population division. Total land area is from FAOSTAT.

Average Annual Population Growth Rate refers to the percentage growth in the midyear population of each country. The values are estimated using demographic models based on several kinds of demographic parameters: a country's population size, age and sex distribution, levels of internal and international migration, fertility and mortality rates by age and sex groups, and growth rates of urban and rural populations. Information collected through recent population censuses and surveys is used to calculate or estimate these parameters.

Urban and **Rural** areas are defined by parameters that vary slightly from country to country. Many countries define an urban area by the total number of inhabitants in a population agglomeration. Typically the threshold for considering a region urban is between 1,000 and 10,000 inhabitants. Any person not inhabiting an area classified as urban is counted in the rural population.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=451&themeid=4

Percentage of Population **Under age 15** or **Over age 65** refer to the de facto population of a given country or region in the given age groups as of July 1 of a given year. All projections assume medium levels of fertility. View full technical notes at:

http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=370&themeid=4

Living in Urban Areas refers to the midyear population of areas defined as urban in each country. View full technical notes at:

http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=446&themeid=4

Average Total Fertility Rate is an estimate of the number of children an average woman would have if current age-specific fertility rates remained constant during her reproductive years. All projections are for the medium-case fertility scenario, which makes three assumptions. 1) Fertility in high-fertility countries will decline at an average pace of nearly one child per decade starting in 2005 or later, so that some of these countries do not reach replacement level (2.1 children per woman) by 2050. 2) Fertility in medium-fertility countries is assumed to reach replacement level before 2050. 3) Fertility in low-fertility countries is generally assumed to remain below replacement level during most of the projection period, reaching by 2045-2050 the fertility of the cohort of women born in the early 1960s or, if that information is lacking, reaching between 1.7 and 1.9 children per woman.

Infant Mortality Rate is an approximation of the number of deaths per 1,000 live births per year who die within one year of birth. The data are based on a review of all available national sources by the Population Division of the UN Secretariat. In developing countries where civil registration data are deficient, the most reliable sources are demographic surveys of households. Where these are not available, other sources and general estimates are made which are necessarily of limited reliability.

Under-Five Mortality Rate is the probability of a child dying between birth and age five expressed per 1,000 live births. The data is reported by countries from their national civil registration systems. Some are estimates prepared by national and international statistical services from population surveys. The completeness and accuracy of the data which these systems produce vary from one country or area to another.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=385&themeid=4

Female Life Expectancy at Birth and **Male Life Expectancy at Birth** is the average number of years that a newborn baby is expected to live if the age-specific mortality rates effective at the year of birth apply throughout his or her lifetime. The Population Division of the UN Secretariat prepares estimates and projections based on data from national statistical sources. When needed, other sources, mainly population censuses and demographic surveys, are consulted. In countries highly affected by the HIV/AIDS epidemic, estimates of the impact of the disease are made explicitly by projecting the yearly incidence of HIV infection.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=379&themeid=4

Births Attended by Trained Personnel is the percentage of births attended by physicians, nurses, midwives, or primary health care workers trained in midwifery skills. Women are most in need of skilled care during delivery and the immediate postpartum period, when roughly three-quarters of all maternal deaths occur. http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=395&themeid=4

Adults and Children Infected with HIV/AIDS is the estimated number of people with HIV infection, whether or not they have developed symptoms of AIDS, alive at the end of 2001. The 1999 prevalence rate published by UNAIDS was applied to the country's 2001 population to produce these estimates. Children are defined as those aged 0–14. Adults are defined as those aged 15–49.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=396&themeid=4

Percent of Adults Ages 15-49 infected with HIV/AIDS is the estimated percentage of people aged 15-49 living with HIV/AIDS. These estimates include all people with HIV infection, whether or not they have developed symptoms of AIDS, alive at the end of 2001. To calculate the adult HIV prevalence rate, the estimated number of adults living with HIV/AIDS at the end of 2001 was divided by the 2001 adult population (aged 15–49).

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=397&themeid=4

Number of Children Orphaned by AIDS since the beginning of the epidemic is the estimated number of children under 15 who have lost their mother or both parents to AIDS since the beginning of the epidemic.

Improved Water and Sanitation

Access to Improved Sanitation. Improved Sanitation includes any of the following excreta disposal facilities: connection to a public sewer, connection to a septic tank, pour-flush latrine, simple pit latrine, and ventilated improved pit latrine. The World Health Organization (WHO) emphasizes that these data measure access to an *improved* excreta disposal system--access to a *sanitary* system cannot be adequately measured on a global scale. The dataset did not provide a standard definition of **Urban** or **Rural** areas. The countries' own working definition of urban and rural was used.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=403&themeid=4

Access to Improved Water. An improved water source includes any of the following types of drinking water sources: household connections, public standpipes, boreholes, protected dug wells, protected springs, and rainwater collection. At least 20 liters per person per day of this water must be available within one kilometer of a user's dwelling. WHO emphasizes that these data measure access to an *improved* water supply--access to a *safe* water supply cannot be adequately measured on a global scale. The dataset did not provide a standard definition of **Urban** or **Rural** areas. The countries' own working definition of urban and rural was used.

School Enrollment and Literacy

Net Primary School Enrollment is defined as the enrollment of the official age-group for a primary level of education, expressed as a percentage of the population from the same age group. If the value is below 100%, users should not assume that the remaining school-aged population is not enrolled in any school; they could be enrolled in school at other grade levels. Primary Education is defined by the International Standard Classification of Education (ISCED) as the "beginning of systematic apprenticeship of reading, writing and mathematics". Programs are typically six years long and represent the beginning of compulsory education in many countries.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=411&themeid=4

Net Secondary School Enrollment is defined as the enrollment of the official age-group for a secondary level of education, expressed as a percentage of the population from the same age group. If the value is below 100%, users should not assume that the remaining school-aged population is not enrolled in any school; they could be enrolled in school at other grade levels. Secondary education follows primary education, and is characterized as being subject-oriented with specialized fields of learning. Programs may be vocational or technical in nature, and students achieve a full implementation of basic skills.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=418&themeid=4

Gross Tertiary School Enrollment is defined as the total enrollment, regardless of age, expressed as a percentage of the official school-age population for a tertiary level of education. Gross enrollment ratio can be over 100% due to the inclusion of over-aged and under-aged students. Such values indicate that a country is, in principle, able to accommodate all of its school-age population. Tertiary education provides the level of education required for entry into an advanced research program or a profession with high skills requirements. Faculty are typically required to have advanced research credentials. View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=423&themeid=4

Literacy Rates are determined through census and survey data. If that information is lacking, estimates are based on neighboring countries with similar characteristics, including life expectancy at birth, enrollment ratio in secondary education, and fertility rate.

Adult Literacy Rate is defined as the population of women or men aged 15 years and over who cannot both read and write with understanding a short, simple statement on their everyday life. This indicator can be used to measure gender parity in education, the achievement of literacy programs and the effectiveness of primary education.

View full technical notes at: http://earthtrends.wri.org/searchable_db/variablenotes_static.cfm?varid=409&themeid=4

Youth Literacy Rate is defined as the percentage of the population aged 15 to 24 years old who can both read and write with understanding a short, simple statement on their everyday life. Youth illiteracy rates are increasingly used to gauge the impact of primary education as well as the speed with which illiteracy can be eradicated.
